## ABSTRACT:

PROBLEM TO BE SOLVED: To provide a production managing device to indicate information on the process, which is worked in priority, of processes to a worker, in a production line containing a plurality of machining processes juxtaposed with each other.

SOLUTION: A process wherein the number of processed products in a stock does not attain the number of subsequent delivering products is selected by an insufficient process selecting part 56. A time required for replenishing of the insufficiency is calculated by a number of delivering products achieving time calculating part 58. The margin of the time having at a subsequent delivery time based on a production plan is calculated by a margin time calculating part 60. A priority order is given, in order, from a product having a low surplus time by a priority order indicating part 62 and the given number of processes are selected from a high order of process. Priority indication is effected on the process by a lamp. This constitution effects high-efficient work and suppresses the occurrence of a deficient and excess stock.
